

Rapid Recovery Plan Automation

Populating RRP Templates from CMDB & ServiceNow Data

Prepared for Hari Pothakamuri, Leslie Maclean & Rohina Emerson
SME: Thabani Ndhlovu | Architect: Amar Yogeswaran
March 17, 2026

Agenda

What we'll
cover today

- 01** Current State & Scale
- 02** Automation Approach
- 03** How It Works — End to End
- 04** Template: Manual vs. Automated
- 05** Process Flow Comparison
- 06** Template Mapping & Data Sources
- 07** Proof of Concept — New Relic
- 08** Sample POC RRP Reports
- 09** Why This Is Not Simple
- 10** Timeline, Effort & Next Steps

Current State & Scale

134

Gold applications require Rapid Recovery Plans.
Manual creation at this scale is not sustainable.

Time-Intensive

Each RRP takes hours to manually compile from CMDB records, spreadsheets, and tribal knowledge.

Inconsistent Quality

Different teams produce RRs in different formats with varying completeness.

Data Fragmentation

CI data, contacts, support groups live across CMDB (V9), spreadsheets, and emails.

ServiceNow Form Gap

The SNOW form exists but must be populated manually per app — no bulk path today.

The Automation Approach

We are building an engine that generates complete RRP documents in seconds from CMDB data.

Seconds

Report generation time
once data is available

6 Sections

Auto-populated from
CMDB & SNOW data

134 Apps

Targeted for automated
RRP generation

How It Works — End to End

Key Requirement: Data Accuracy in CMDB

CI numbers must match between V9 and source spreadsheets. If CMDB team clarification is needed — Alex has been invited to help resolve discrepancies.

The RRP Template — Today vs. Automated

Manual Process (Today)

1. Open ServiceNow RRP form
2. Look up CI in CMDB (V9) manually
3. Copy-paste fields into SNOW form
4. Research support groups, contacts
5. Write triage & recovery steps
6. Repeat for each of 134 apps

Automated Process (Target)

1. Engine pulls CI data from CMDB
2. Maps fields to all 6 RRP sections
3. Generates complete DOCX in seconds
4. SME reviews for accuracy (quick pass)
5. Approved RRP ready for distribution
6. Scales to all 134 apps automatically

Process Flow – Manual vs. Automated

MANUAL (Today)

🕒 ~3–4 hrs/app × 134 apps = 375–500 hours

INTERNAL

AUTOMATED (Target)

⚡ ~mins/app × 134 apps = minutes total

Template Mapping & Data Sources

Each section of the RRP template maps to specific CMDB/SNOW fields:

RRP Section	Data Source	Key Fields	Status
Application Taxonomy	CMDB (V9)	CI Class, Service Classification, Display Name	Available
Tech Stack Support Groups	CMDB / SNOW	Support Group, Managed By, Owned By	Available
Triage & Recovery	Runbooks + Template	Recovery procedures, health checks, escalation	Partial
Vendor Coordination	CMDB / Contracts	Vendor contacts, support portals, SLAs	Partial
RTO & Impact Analysis	BIA / CMDB	RTO targets, criticality, SLA impact	Available
Contacts & Appendices	CMDB	CI Snapshot, owners, links, operational status	Available

Proof of Concept — New Relic (PROD)

A sample RRP was generated for 3 New Relic Production CIs using CMDB data. Additional samples are being produced.

Display Name	CI ID	Criticality	Support Group	Managed By
New Relic - NA - PROD	CI00000507448	2-Gold	ETS-OAR-IPCR-GBL	Brian Malia
TRS New Relic-Prod	CI00000278504	2-Gold	GWAM-RPS-TRS_SWAT-IPR	E. Janse van Rensburg
NR Synthetic Priv. Loc. - PROD	CI00085768841	2-Gold	ETS-OAR-IPCR-GBL	Rahul Mehta

Key Findings from Generated Report

- ✓ All 6 RRP sections auto-populated from CMDB fields
- ✓ CI snapshot table and contacts appendix generated automatically
- ✓ 8-step triage & recovery sequence mapped from template

Sample POC RRP Reports

5 sample RRP reports generated in PDF format from CMDB data — ready for review.

Edge

RRP report generated from CMDB data covering all 6 template sections. PDF available for review.

Active Directory

RRP report generated from CMDB data covering all 6 template sections. PDF available for review.

New Relic

RRP report generated from CMDB data covering all 6 template sections. PDF available for review.

US Alfresco

RRP report generated from CMDB data covering all 6 template sections. PDF available for review.

Akamai

RRP report generated from CMDB data covering all 6 template sections. PDF available for review.

What Makes This Challenging (and How we Address It)

Automation accelerates the work — but the underlying data and process complexity remains real.

CMDB Data Accuracy

CI numbers do not match between V9 and source spreadsheets. Until the CMDB team resolves discrepancies (Alex invited), we cannot guarantee automated output. This is the #1 blocker.

One CI per App vs. Multiple CIs

Some services like New Relic map to 3 CIs (NA, TRS, Synthetics). Going forward we target one CI per app, but the data model varies and recovery scope differs per CI.

Integration Maps Missing

Application dependency diagrams are not formally documented. Automation can flag the gap but cannot generate what doesn't exist in source systems.

Triage Steps Are Team-Specific

Recovery procedures are partially template-driven, partially tribal knowledge. SME input is still required per application for complete triage sequences.

Vendor Contacts Scattered

No single source of truth for vendor contacts. Data lives across contracts, CMDB, emails. A consolidated repository is needed for full automation.

Timeline & Effort Estimate

Stage 1 — Data Validation

Resolve CMDB discrepancies with Alex & CMDB team; confirm CI field mappings; validate data accuracy for pilot scope.

Wk 1–2

~40 hrs

Stage 2 — Template Engine Build

Build automation script to extract CMDB/SNOW data, map to RRP template sections, and generate DOCX output.

Wk 2–4

~60 hrs

Stage 3 — Pilot & Review

Generate RRP for pilot applications. SME review for accuracy. Iterate on template and data gaps.

Wk 4–5

~20 hrs

Stage 4 — Scale & Handoff

Expand to remaining 134 applications. Document runbook for ongoing generation. Integrate review workflow.

Wk 5–7

~30 hrs

Total Estimated Effort: ~150 hours | Duration: ~7 weeks | 134 applications

Next Steps

- | | | |
|----------|---|------------------|
| 1 | Amar Delivers Additional Samples
2–3 realistic sample RRP's generated from CMDB data for review and validation. | Amar |
| 2 | Review Sample RRP's
Leslie & Rohina review generated New Relic RRP and additional samples; provide feedback. | Leslie / Rohina |
| 3 | Resolve CMDB Discrepancies
Alex and CMDB team to clarify CI number mismatches between V9 and source spreadsheet. | Alex / CMDB Team |
| 4 | Confirm Scope & Segment Breakdown
Break 134 apps into segments so each team has visibility into their workload. | Hari / Leslie |
| 5 | Thursday Follow-Up Call
Reconvene to discuss feedback on samples, align on Stage 1 kickoff, and confirm segment assignments.
