

OAR Community of Practice

Fostering collaboration and shared expertise effectively

July 10, 2026

Agenda

- 01** COMMUNITY OF PRACTICE OVERVIEW
Purpose, structure, and participation
- 02** HOW THE COMMUNITY WORKS
Meeting cadence and topic submission
- 03** MEET OAR
Team structure, scope, and support model
- 04** OAR CAPABILITIES & CURRENT FOCUS
Observability initiatives and services
- 05** DISCUSSION & Q&A
Discuss questions, insights, and future topic suggestions

Community of Practice Overview

Purpose

Unifying Observability Practices

Community of Practices creates a **platform to advance observability and monitoring** across teams for **system reliability**

Observability Monitoring Tools

Overview of tools like **application monitoring and AI Ops platforms** helps teams to optimize **system visibility**

Enhancing Operational Resilience

Sharing best practices and aligning standards **reduce duplication and improve troubleshooting efficiency**

Fostering Team Collaboration

The community supports **knowledge sharing and innovation scaling** to strengthen monitoring maturity organization wide

How The Community Works

The How's, When's, and Why's

Consistent Monthly Schedule

Meetings occur **every third week of the month** to maintain a reliable and predictable rhythm for participants

Dual Time Zone Sessions

Two sessions accommodate participants from Asia and North America, ensuring **global inclusivity and collaboration**

Purposeful Meeting Content

Sessions focus on **updates, challenges, tracking progress**, and **new ideas** related to observability and monitoring initiatives

Promoting Engagement and Accountability

Regular meetings facilitate **continuous learning, tracking progress**, and fostering **sustained collaboration**

How to Submit Topics

Encouraging Active Participation

Members contribute by **submitting ideas and challenges**, fostering a collaborative community environment

Submission Methods

Topics can be submitted via **Microsoft Teams messages, emails** to the **OAR Team mailbox** or through **Viva Engage**

Impact on Meeting Agendas

Submitted topics shape future meeting discussions, **ensuring relevance and practical outcomes** for members

Meet OAR

We are Global Technology Operations

Empowering Manulife’s business and IT teams through integrated operations – enhancing uptime, strengthening reliability, and driving continuous improvement through disciplined practices and a commitment to excellence.

Hari Pothakamuri
VP Global Technology Operations

★ **Joan Lee**
Global Technology Operations

Observability & Reliability Product
Jason Andrews

Observability & Reliability Ops
Debamalya Das

Global Batch Operations
Eric J Vaughan

GOCC Application Operations
George Francis Fermo

Service Delivery
Izza Rynavet Medrano Ilagan

★ **Rohina Emerson**
Global Service Management

Operational Excellence
Carrie Elg

Problem Management
Chantel Love
Hans Christian De Guzman
Gregg White

Incident Management
Mike Todic
Paul Miller
Thabani Ndhlovu

Change Management
Ron Ferrier

Jonan Tan Pangan
GOCC Platform Operations

Service Delivery
Dennis Talento
Aldwin Sto Tomas Amat
Rudini Cruzat
Joy Madridano Bio

Peter Yen
Operational Insights and Intelligence

Reporting Service
Martin Robillard-Beaulac

Operations Insight
Gerlyne Mari Bautista

Quality Assurance
Anthony Chan

Operations Intelligence and Efficiency
Peter Yen

We are OAR Architecture

We are OAR Engineering

Debamalya Das
Director, Observability & Resilience, HK

Kyle Moyer
Automation & Innovation

Team

Ge, William
Majeti, Snigdha
Talpur, Mir Abdul Rafay
Valerio, Carlo
Velalakan, Niruthieka
Tariq, Mohammad

Driving

- All Scripting Automations
- Ansible
- OAC
- Integration with Desired State/ Cloud Catalog
- Auto Instrumentations
- AI Bots
- Agent Rollouts

Adrian Velasco
AI Ops, Event Correlation

Team

Sangha, Kabir
Serrano, Kyle Eiron
Shaikh, Faheem Salim
Spera, Alec
Drien Reyes, Dan

Driving

- Moogsoft support
- Event Correlation
- Self Healing
- R2R
- Certificate & keys enhanced monitoring
- Chaos Engineering

Jeremy Page
Telemetry

Team

Adducul, Mark Oliver
Adtani, Faizaan Salim
Darjuan, Angelito
Dias, Jerica
Bajwa, Shehroz

Driving

- New Relic & other monitoring tools
- Azure Health Alerts & maintenance
- R2R
- ETS Platform support
- Policies & guardrails
- Audits
- Account Management

Edward Ian
Operations, KLO

Team

Advincula, Queenie Amabelle
Bias, Karl Angelo
Ibay, Jan Rafael
Maamon, Mazen
Malificiar, Diane Grace
Mathew, Aidan
Pepito, Jesus Jr
Quinaso, Mark Jeony
Segovia, Paula Celine
M, Vignesh

Driving

- KLO
- Synthetics
- GBO batch monitoring
- GOCC Asks
- R2R
- Segment Asks
- Operations
- KPIs, incident prevention

OAR Support Overview

Support paths from quick help to custom observability solutions.

How to engage OAR support

- 1

Email distribution list
ETS_OAR@manulife.ca
- 2

Viva Engage
[Observability and Resiliency](#)
- 3

Service Now Catalog
[Observability Tool Support \(Global\)](#)

Support we provide

- Standard observability tooling support
- API key creation and access guidance
- Synthetics help and troubleshooting
- Ingestion issue investigation
- Consultation to enhance monitoring coverage

Operational enablement

- Automated synthetics cleanup
- GOCC onboarding assistance
- Ansible tagging support

We partner with teams beyond break/fix: identify repeat patterns, improve monitoring quality, and align support work to operational standards.

Custom tooling, reporting & solutions: OAR will work with you to solve monitoring gaps or operational issues that out-of-the-box capabilities cannot easily address.

OAR Capabilities

Current OAR Team Focus

1 >

Monitoring Maturity Model

MMM Level 2 focuses on enhancing monitoring for critical applications to improve observability and reliability standards.

2 >

Synthetics Development

Synthetics Bot for development of standard or simple Synthetics with minimal user input.
Synthetics Training available through Compass now!

3 >

Observability Tooling Consolidation

OEM, PRTG, and Asia Network

OAR Capabilities

Moogsoft

A Window into Moogsoft

AIOps signal flow: consolidate alert streams, correlate them into Situations, then automate repeatable BAU fixes.

1 Ingestion methods

Alerts flow in from monitoring, messaging and cloud channels.

- New Relic
- Email Integrations
- OEM
- Azure
- ADX

Telemetry + alerts

Moogsoft correlation

Automated response

2 Event correlation

Moogsoft deduplicates, enriches and clusters related alerts from multiple tools into an actionable Situation.

3 Pattern-based healing

Recurring patterns map to a known remediation path; an Ansible playbook executes the BAU self-healing fix.

Result: reduced alert noise, faster triage, and repeatable self-healing for common business-as-usual incidents.

OAR Capabilities

MMM and Top Digital

Monitoring Maturity Model L2

All eligible Gold applications will be uplifted to MMM L2 standards.

Standardized model ensuring key monitoring signals are visible, correlated, and actionable

Key Monitoring Signals

- APM
- Browser
- Infrastructure Monitoring
- Synthetic Journey Monitoring
- Logs (ADX)

Monitoring signals across tools should be visible in Moogsoft with standardized application tagging to support operational awareness and incident response

New Relic – Detailed Metrics

Visible, Correlated, and Actionable Monitoring Signals

Discussion & Q&A

Share your questions, insights, and future topic suggestions

Appendix

L1 Accomplishments and L2 Goals

LEVEL 1

Synthetic Monitoring

- Ping or simple browser synthetics

Infrastructure

- Infrastructure monitoring default alerting

Alerting

- Onboard L1 to GOCC for initial triage

LEVEL 2

Synthetic Monitoring

- Advanced or functional synthetics
- Focusing on login (scripted browser or step browser), scripted API, or another feature more elevated than ping

APM

- APM default alerting
- Agent must be recent (not EOL)
- DTT enablement

Browser

- Agent must be recent (not EOL)
- DTT enablement

ADX

- Send logs to ADX (validate webhook to Moogsoft)

Alerting

- L2 alerting will be assigned to either the support team or GOCC (teams can decide)

Breaking down the Build Stage

APM/Browser	Infrastructure	Synthetics	Logs (ADX)
Inputs: • Check if APMs already in place • Get tech stack/platform (if no APM yet)	Inputs: • List Infra components and names	Inputs: • Login credentials • Apps URL • Application details functional journey • - Key pages and services to be monitored	Inputs: • Check if ADX/Moogsoft integ already in place • Get tech stack/platform (if none yet) • Inventory of logs critical for App owners to monitor
(c/o owner) If no APM/Browser yet: 1. Find correct agent based on tech stack 2. Implement in Non Prod 3. Implement in Prod (possible outage) 4. App code tagging If with APM: 1. Agent update (unless DTT enabled) 2. App code tagging	1. Create default alert condition (if not yet existing) 2. Onboard in Moogsoft 3. Assign to Service Now Queue 4. App code tagging Note: OAC to be developed for net new infra types	1. Develop Synthetic monitor 2. Firewall requests (if needed) 3. Onboard to Moogsoft 4. App code and synthetic type tagging 5. GOCC AMS Runbook onboarding	1. Onboard ADX in Moogsoft 2. App code tagging

Event Correlation (Moogsoft)
