

20260326 - New Relic Monitoring

IS and ETS

Final Meeting Notes

Meeting: RE: New Relic Monitoring

Focus: Japan-based observability, dashboard delivery, and GOCC operating model

1. Objective Confirmation

- The objective was confirmed as establishing **Japan-based observability** to improve **user experience (Employee Experience)** and **developer/tester experience (Developer Experience)**.
 - Monitoring should reflect **actual experience from Japan**, not inferred availability from other regions.
-

2. Scope: Dashboards

- Two consolidated dashboards are in scope:
 - **Employee Experience Dashboard**
 - Focused on **production systems**
 - Highlights real availability and user-facing impact
 - **Developer Experience Dashboard**
 - Focused on **non-production (SIT/UAT/DEV)** environments
 - Supports developers and testers with environment health visibility
 - Dashboards will prioritize **impact-driven views**, highlighting active alerts and enabling drill-down into affected applications and services.
-

3. Current State of Monitoring

- Monitoring today is **fragmented** and partially manual, with significant effort handled by the **PS team**.
- Synthetic monitoring is primarily:
 - **URL availability checks**
 - **APM-based performance monitoring** (CPU, memory, DB, services where available)

- Data refresh cadence discussed was **near real-time (approx. every 10 minutes)**.
 - A tracking sheet is used to manage onboarding and monitoring coverage.
-

4. Application Onboarding to GOCC

- **16 applications** have already been transitioned from PS monitoring to **GOCC**.
 - Long-term goal is to onboard **all systems** into a **standardized GOCC monitoring model**.
 - GOCC monitoring focuses on:
 - URL monitoring
 - Alert triage
 - Runbook-driven first response
 - Incident routing via **ServiceNow** and **xMatters**
-

5. ePOS (EPOS) Monitoring – Deep Dive

Architecture & Access

- ePOS runs on **AKS** and is monitored using **New Relic APM with distributed tracing**.
- Access path:
 - Via **Manulink**
 - Uses **SSO / LTPA token + cookie-based authorization**
 - Same credentials as Manulink
- Development environments use **form-based authentication**.

Existing Monitoring & Dashboards

- ePOS already has:
 - Dashboards tracking **application submissions, DB operations**, and **service health**
 - Alerts generated primarily from **ADX logs** (error-based)
- Monitoring includes:
 - URL checks
 - APM metrics (CPU, memory, DB connections)
- ePOS aligns with **Level 3 observability maturity**:
 - Synthetic monitoring
 - APM
 - Business transaction visibility
 - Centralized logs

- Certificate monitoring

Health Check Procedures

- PS team currently performs **daily manual health checks**, including:
 - Logging into Manulink
 - Creating applications
 - Verifying workflow completion
 - A **batch process in Manulink** runs checks against ePOS:
 - This script is owned by the PS team
 - Known contacts: **Nakatsu-san, Yamamoto-san, Murata-san**
 - GOCC will need visibility or access to this process for sustainable handover.
-

6. Non-Production Environment Monitoring

- Non-production environments (SIT/UAT) represent a **large operational burden**.
 - ePOS alone has **~17 environments**, contributing to maintenance overhead.
 - ePOS is **not currently included** in the **daily non-prod monitoring alert email** sent by TEM.
 - This gap was acknowledged.
 - Monitoring parameters for non-prod need confirmation with **TEM (Sangram)**.
-

7. Authentication & PII Guardrails

- **PII handling**
 - ADX provides **PII masking**
 - No PII is logged in New Relic or ADX
 - Debug logging is disabled in production
 - **Test environments**
 - Contain **test data only**
 - Any production data synced to PS environments is **masked**
 - **Authentication for monitoring**
 - GOCC monitoring requires a **service account** to authenticate through Manulink
 - Authentication is **key-based**, not user-based
-

8. Routine Maintenance & Offloading Opportunities

- Opportunities were identified to shift routine operational tasks to GOCC:

- **Certificate renewals**
 - Already automated and managed by GOCC
 - **SPN renewals**
 - Regional solution available using **Managed Identity + federated credentials**
 - Planned for adoption by ePOS and other AKS platforms
 - **Service account password management**
 - Opportunity to automate further (e.g., vaulting)
-

9. Environment & Database Management (ePOS)

- Environment and DB scaling is currently:
 - Handled **ad hoc by the development team**
 - BAU teams (Chetan) focus primarily on production and PS activities
 - There is an opportunity to improve:
 - **On-demand environment enablement**
 - Automated refresh to latest codebase
 - Spin-up / spin-down of environments and databases when needed
 - **Chetan** was identified as the key contact for ePOS environment management.
-

10. GOCC Delivery Model (Agreed Direction)

- **Top monitoring priorities**
 - a. URL availability
 - b. Performance / APM
 - c. Rapid Recovery
 - **ServiceNow CMDB**
 - Must maintain relationships between:
 - Applications
 - Application Services
 - Components (DB, middleware, etc.)
 - Support groups and xMatters registration must remain current
 - Directionally agreed:
 - GOCC handles **standardized monitoring and first response**
 - Application teams retain ownership of application logic, auth flows, and runbooks
-

11. Follow-up Actions

Action	Owner
Obtain details of the ePOS health check script used by PS (Manulink batch)	David (follow up with Yamamoto-san / Murata-san / Nakatsu-san)
Share daily non-prod monitoring status email and highlight ePOS gap	Kiran Mohandas
Connect David with Chetan to discuss on-demand ePOS environment refresh / spin-up process	Kiran Mohandas
Confirm non-prod monitoring parameters with TEM (Sangram)	David / Kiran Mohandas
