

20260331 - Monitoring Discussion

1) Objective (re-confirm each session)

Establish **Japan-based observability** that reflects **actual user experience in Japan** and improves:

- **Employee Experience Dashboard (Prod)** visibility and impact-driven drilldowns
 - [Employee Experience Dashboard](#)
 - PS Team will share Morning Health Check dashboard (Excel, SP, pbi)
- **Developer Experience Dashboard (Non-Prod: DEV/SIT/UAT)** visibility for dev/test health and faster troubleshooting [\[GOCC-20260...326-035913 | PDF\]](#)
- **Monitoring in Branch Offices (Laptops)**
 - Laptops (5) are set up and waiting to be deployed
 - Deployment schedule check with Mochi and Omori
- **Nodes inside JPE/JPW for external monitoring**
 - Kyle Moyer (OAR North America)
 - Confirm schedule with Deb
- **Achieve OMM L2 for all major Japan Applications**
 - PS Team (Yamamoto-san) provide credentials for accessing applications inside portal
 - OAC Observability as Code policy in-progress for APM services

Principle: Monitoring must reflect **Japan reality**, not inferred availability from other regions.

-

3) Updated Agenda (recommended 30–45 min)

A. Quick Status Round (10 min) — last actions & blockers

Review progress on:

- Japan synthetic coverage (JP East/West hosting, laptop monitors, URL inventories)
 - Pending Deb to provide scope
 - Nakatsu-san provide Microservice namespaces and clusters to Mary Kris, Sree and Vignesh
 - APM + distributed tracing rollout list and install confirmation - Naveen
 - EPOS - AKS
 - JCMS - AKS
 - JCUS - AKS
 - CWS (API) - AKS
 - SOLACE - AKS
 - MIDAS - AKS
 - SURF - AKS
 - CLAIMS - AKS
 - JPS - AKS
 - PWS - AKS
 - All other Applications need to be reviewed with PS Team and Balaji
 - Tagging standards + bulk tagging approach (Azure + New Relic)
 - Look at Super Ops Incident report Powerbi and how they filter Japan Region - Mary Kris work with Team to brainstorm best filter for tagging Japan
 - Certificate / SPN dashboards baseline + thresholds
 - Alert coverage gaps inventory + recommendations
 - JP monitoring coverage report (Power BI)
 - Inner-source repo access & contribution model
 - Docker modularization of monitoring script
-

B. Theme 1 — End-User Connectivity & Synthetic Monitoring (10–15 min)

Goal: Close Japan visibility gaps and detect location-specific network/config issues early.

Discussion prompts

- Confirm approach: **monitoring laptops at user sites** + synthetic scripts integrated with New Relic (early warning)
- Confirm requirement: **Japan-hosted synthetic** (Azure JP East/West) and onboarding gaps to address
- Confirm scope: **Private website monitoring** (internal) vs public endpoints
- Confirm inventory ownership:
 - “Manulife nodes + New Relic nodes in Japan” request tracking
 - Internal + external URL list for Japan in Prod/Pre-Prod (as assigned in your notes)
- Confirm working group cadence: **Script working group (1 hr)** participants and deliverable

Outputs to capture

- JP East/West hosting decision & target date
 - URL inventory owner + completion date
 - Laptop deployment scope + success criteria (what “good” looks like)
-

C. Theme 2 — APM & Distributed Tracing Enablement (10–15 min)

Why: Infra + URL checks aren’t enough for RCA; tracing identifies latency + bottlenecks.

Baseline context to carry forward

- APM is application-level (agent), distinct from infra agent
- Distributed tracing is required for transaction path and network latency diagnosis
- Coverage in Japan is inconsistent (per your notes)
- Example deep dive: ePOS runs on AKS and uses **New Relic APM with distributed tracing**
[\[GOCC-20260...326-035913 | PDF\]](#)

Capture in meeting

- Rollout list confirmation (apps + owners)
 - Install/config status confirmation method (what evidence is required)
 - Any auth/PII constraints impacting instrumentation
-

D. Theme 3 — Monitoring Coverage, Tagging & Data Quality (10–15 min)

Why: Filtering/reporting for Japan depends on clean tagging and ownership hygiene.

Baseline context to carry forward

- Tagging gap prevents Japan filtering (e.g., `country=JP`)
- Azure vs New Relic tagging differs; bulk tagging (e.g., Ansible) is available (per your notes)
- GOCC operating model depends on CMDB relationships and current support group/xMatters data [\[GOCC-20260...326-035913 | PDF\]](#)

Capture in meeting

- Tagging standard (minimum required fields)
 - Ownership/registration rules (CMDB alignment)
 - “Definition of Done” for “JP onboarded & reportable”
-

E. Theme 4 — Monitoring Policy Automation & Code Collaboration (5–10 min)

Goal: Standardize and scale with flexibility using observability-as-code.

Capture in meeting

- OSC repo structure / contribution workflow (inner-source)
 - Pipeline model (self-service by app teams) + review gates
 - Threshold strategy: “standard baseline + app-specific overrides”
-

F. Theme 5 — Governance, Cadence & Stakeholder Alignment (5 min)

Carry-forward decision: recurring Japan monitoring forum (preferably Mondays) + shared artifacts as source of truth (Confluence/SharePoint/dashboards/reports).

(Your notes state the cadence decision; the PDF reinforces “shared baselines and ongoing model” via dashboards + tracking sheet usage.) [\[GOCC-20260...326-035913 | PDF\]](#)

6) Action Items (Owner → Deliverable → Due → Status)

Pre-populated from your notes + carry-forward from the March 26 PDF actions section.

Action	Owner	Deliverable	Due	Status / Notes
--------	-------	-------------	-----	----------------

Define Japan apps requiring distributed tracing + confirm APM install status (AKS list includes EPOS + others from your notes)	Birger	Rollout list + install confirmation status		
Share tagging & nomenclature standards + bulk tagging guidance (Azure & New Relic)	Debamalya, Sree	Confluence guidance + minimum tags (e.g., <code>country=JP</code>)		
Distribute certificate & identity dashboards + baseline/threshold docs	Debamalya, Avignesh	Dashboards + threshold rationale		
Inventory JP resources lacking alerts + remediation recommendations	Debamalya	Alert coverage gaps list		

Provide JP monitoring coverage report	Debamalya	Power BI coverage report (JP-filtered) + mapping doc		
Enable code collaboration (inner-source repo access)	Debamalya, Balaji	Access + contribution workflow		
Modularize monitoring script in Docker; coordinate with Obs counterpart	Naveen (coord: Deb)	Containerize d module + run instructions		
Obtain details of ePOS health check script used by PS (Manulink batch)	David	Script details + access path/ownership		
Share daily non-prod monitoring status email; highlight ePOS gap	Kiran Mohandas	Forward + gap statement + next step		
Connect David with Chetan re: on-demand ePOS env refresh /	Kiran Mohandas	Intro + meeting scheduled		

spin-up process				
Confirm non-prod monitoring parameters with TEM (Sangram)	David / Kiran Mohandas	Confirmed scope + acceptance criteria		

7) Risk / Issue Register (lightweight)

Risk / Issue	Impact	Mitigation	Owner
Japan synthetic coverage gaps persist until JP East/West hosting & onboarding are standardized	Continued “Japan-only” incidents / blind spots	Prioritize JP nodes + URL inventory + onboarding playbook	
Data quality (tags/ownership/registration) blocks accurate JP filtering & reporting	False confidence / missed alerts	Enforce minimum tags + bulk tagging automation + CMDB hygiene	
APM/tracing rollout depends on app owners	RCA delays	Publish rollout list + install evidence requirement + escalation path	

Optional “Done Criteria” (useful for governance)

A system is considered **Japan-observable** when it has:

1. Japan-hosted synthetic checks (internal/private where needed)
2. APM installed (where applicable) + tracing enabled for critical paths
3. Minimum tags present (incl. `country=JP`) and ownership set
4. Alert coverage validated and visible in coverage report
5. Included in Employee/Developer Experience dashboards
